

Creating a GitHub Repository

Jeffrey Leek, Assistant Professor of Biostatistics Johns Hopkins Bloomberg School of Public Health

Recap: Git vs. GitHub

- · You don't need GitHub to use Git
- · Git = Local (on your computer); GitHub = Remote (on the web)
- · GitHub allows you to:
 - 1. Share your repositories with others
 - 2. Access other users' repositories
 - 3. Store remote copies of your repositories (on GitHub's server) in case something happens to your local copies (on your computer)

Creating a GitHub Repository

- · Two methods of creating a GitHub repository:
 - 1. Start a repository from scratch
 - 2. "Fork" another user's repository
- · We'll start with the first method
- · NOTE: A repository is often referred to as a "repo"

Start a Repository From Scratch

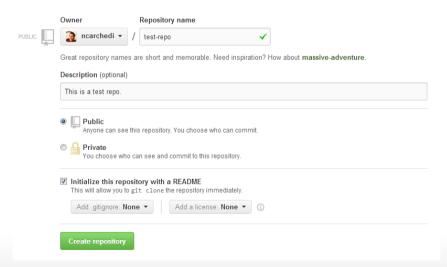

· Either go to your profile page (https://github.com/yourUserNameHere/) and click on "Create a new repo" in the upper righthand corner of the page

...OR...

· Go directly to https://github.com/new (you'll need to log into your GitHub account if you haven't already done so)

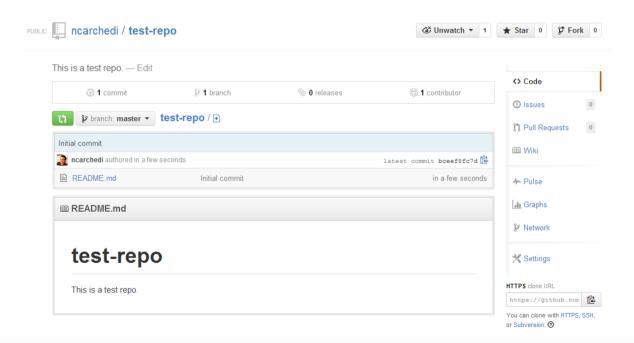

Start a Repository From Scratch

- · Create a name for your repo and type a brief description of it
- · Select "Public" (Private repos require a paid [or education] account)
- Check the box next to "Initialize this repository with a README"
- · Click the "Create repository" button

Start a Repository From Scratch

· Congratulations! You've created a GitHub repository.

Creating a Local Copy

- · Now you need to create a copy of this repo on your computer so that you can make changes to it
- · Open Git Bash
- · Create a directory on your computer where you will store your copy of the repo:

```
$ mkdir ~/test-repo
```

· Navigate to this new directory using the following command:

```
$ cd ~/test-repo
```

- \$ cd /e/'Desktop (important)'
- \$ mkdir Git-repo
- \$ cd Git-repo

Creating a Local Copy

· Initialize a local Git repository in this directory

```
$ git init
```

· Point your local repository at the remote repository you just created on the GitHub server

```
$ git remote add origin https://github.com/yourUserNameHere/test-repo.git
```

Creating a Local Copy

· Here's what this process looks like in action:

```
Welcome to Git (version 1.8.4-preview20130916)

Run 'git help git' to display the help index.
Run 'git help <command>' to display help for specific commands.

Nick@NICK-PC ~
$ mkdir ~/test-repo

Nick@NICK-PC ~
$ cd ~/test-repo

Nick@NICK-PC ~/test-repo
$ git init
Initialized empty Git repository in c:/Users/Nick/test-repo/.git/

Nick@NICK-PC ~/test-repo (master)
$ git remote add origin https://github.com/ncarchedi/test-repo.git

Nick@NICK-PC ~/test-repo (master)
$ git remote add origin https://github.com/ncarchedi/test-repo.git
```

Fork a Another User's Repository

- · The second method of creating a respository is to make a copy of someone else's
- · This process is called "forking" and is an important aspect of open-source software development
- · Begin by navigating to the desired repository on the GitHub website and click the "Fork" button shown below

https://help.github.com/articles/fork-a-repo

Clone the Repo

- · You now have a copy of the desired respository on your GitHub account
- · Need to make a local copy of the repo on your computer
- · This process is called "cloning" and can be done using the following command:

```
$ git clone https://github.com/yourUserNameHere/repoNameHere.git
```

· NOTE: This will clone the repository into your current directory.

What Else?

- · If you make changes to your local copy of the repo, you'll probably want to push your changes to GitHub at some point
- · You also may be interested in staying current with any changes made to the original repository from which you forked your copy
- · We will cover some more Git/GitHub basics in coming lectures, but in the meantime, here are some great resources:
 - https://help.github.com/articles/fork-a-repo
